

COLOUR

The durability of a film doesn't only depend on the adhesive and the film quality, but also on the colour stability of the film.

In general, black and white films have a longer life than coloured ones. Green and blue are more stable colours than, for example, red. This is due to the pigments used, for which the life span may differ, depending on the colour used.

In a lot of industries, standard colour tables are used to make work easier. The car and construction industries, for example, use the RAL colours, while the printing industry makes use of Pantone colours.

In this manual you will find a colour reference table of our Grafitack colours with their respective Pantone and RAL colours. **Please note that the references are only approximate.**

GRAFITACK REMOVABLE SERIES		
GRAFITACK NUMBER	PANTONE NUMBER	RAL NUMBER
R02	black	9005
R09	white	9003

GRAFITACK 400 SERIES FLUOR		
GRAFITACK NUMBER	PANTONE NUMBER	RAL NUMBER
411	803	1026
412	802	6018
413	804	2007
416	-	3026
